TITLE: Computerized medical diagnostic and treatment advice system including network access

Detailed Description Text (23):

The voice processing (VP) board 122 supports speech recording and playback, as well as touch tone (DTMF) signal detection and decoding. A device driver, associated with the VP board 122, is loaded into system memory during load operations. The device driver supports communications between the VP board 122 and the application code at run time (e.g., when a person is seeking medical advice). Through a shared memory segment, the device driver sends event and status data to the application code in real-time as events occur on the associated telephone line. These events include the ring of an incoming call, touch tone key pressed by the caller, and the hang-up signal. The VP board 122 plays back speech messages that are stored on the hard drive 152. The algorithm processor 160 sends a selected speech file having an encoded speech message that is retrieved from the hard drive 152 to the VP board 122 at the appropriate time for speech message playback. A speech message can be of variable length with a typical message about one to two minutes in length. Several speech messages may be chained together to produce an extended spoken message, e.g., giving instructions to the patient. During speech file playback, the VP board 122 is monitoring touch tone response from the caller. The VP board 122 may be configured to interrupt speech file playback when a touch tone signal is detected.

Detailed Description Text (395):

Using the Internet and its software mechanisms such as HTML, CGI, and Java permits the MDATA system to: support Internet communication protocols and formats; store charts, tables, graphs, images, photos, video, audio files; store Internet pages and scripts (HTML, CGI, Java); stage scripts and other files for transmission; transmit pages and scripts as requested via the Internet; upload medical data collected by MDATA scripts from patients; download medical data to patients, physicians, labs, and HMOs; download MDATA scripts, programs, and data to patient computers; monitor and manage patient traffic, demand, and queuing; transmit medical data in color, graphics, and sound formats; transmit executable code to user computers; use the users' Graphic User Interface (screen, mouse, dialogs); distribute its computational load to user computers; extend its diagnostic tools to include visual analysis; access other sites via the Internet, such as: HMOs, insurance carriers, credit agency, bank; attending and referred physicians, hospitals, clinics, recovery homes; laboratories, pharmacies, health supply stores; nurses, health practitioners, aides; emergency rooms, paramedics, ambulance services.
